Microsoft 365 with Domain Controller Click to Run™ Solution

Quote

"Having been under great time pressures, to have found the Click to Run™ Solution has been amazing. The process itself is incredibly easy to use and we were supported along the way by the TD SYNEX team who even handheld us, sitting in on deployment, the first few times we used. It meant our engineers could deploy with confidence and ask questions where needed."

Vanishing the Technical Skills Gap with the Power of Click to Run™ Solutions

Defining the Challenge

For San-iT's end users, saving time and accelerating speed to market was vital to achieving successful outcomes. Their client, a well-established university, had the goal of implementing a qualified area for a group of 10 researchers within Cyber Essentials, a government-backed scheme aimed at safeguarding organizations against common cyber threats.

This task presented a tight deadline for the IT support company – a mere two weeks to seamlessly deliver this Cyber Essentials outcome to protect their end-users and enhance the cybersecurity measures. San-iT needed a rapid solution to configure a fully secure environment within Azure that aligned with Cyber Essentials governance and provided promising opportunities for scalability in the future.

There were also challenges due to the company's bandwidth, with the holiday season in full swing at the time, significantly reducing the San-iT team's capacity to accommodate this high-volume workload, especially with more senior engineers away from the office. The temporary skills gap at hand and fewer engineers available to tackle the pending deadline presented several obstacles to overcome.

Exploring the Solution

With the clock ticking and the deadline for deployment fast approaching, San-iT needed a quick, reliable, and market-ready solution. The environment needed to be simple, centrally managed, and fit within Academic A5 licenses on Microsoft 365. As a result, San-iT engaged with TD SYNEX, an innovative global IT solutions aggregator, to explore viable opportunities.

Our team of experts promptly recommended our Microsoft 365 with Domain Controller Click to Run™ Solution, designed as the necessary foundation to move workloads into the cloud and synchronize user identities across active directories. Additionally, the pre-configured, repeatable Click to Run™ Solution offers a complete, intelligent modern workplace platform including a domain controller in Microsoft Azure.

Reflecting on the Results

The quick, reliable, and cost-effective Click to Run™ Solution saved San-iT a vast amount of time, as the deployment was reduced from a projected 20-hour timeline to a seamless deployment lasting only one hour in contrast. Successfully, the solution configured a full network and domain environment with hybrid AADConnect synced into Microsoft 365 from Azure for their end-users. Another benefit – the solution served as a second set of eyes to scan the environment and ensure no steps were overlooked or missed.

San-iT shared that without the support of the Microsoft 365 with Domain Controller Click to Run™ Solution, their team would have struggled to provide the solution on time. Meeting the deadline would have involved canceling senior team member vacations or running the risk of missing the deadline altogether. The San-iT team was very pleased with the results, delivered ahead of schedule and within budget in a technically sound manner, which pleased their clients as well.
